The Maltese article:
Language-particulars and universals

Frans Plank & Edith Moravcsik

What can be said about articles in Maltese, summarized in Part 1, is confronted with cross-linguistic generalizations about this category, and it is seen, in Part 3, that much of what was said about articles in Maltese reflects, or is derivative of, general truths about Language.

1. Truths about Maltese, concerning articles

1.1. Maltese has a definite article, insofar as the definiteness of (most) noun phrases receives obligatory marking.

(1) ir-ragel DEF-man ‘the man’
il-mara DEF-woman ‘the woman’
it-twil DEF-tall ‘the tall one’ (MASC)
it-twil-a DEF-tall-FEM ‘the tall one’ (FEM)
il-maqtal(-a) DEF-killed(-FEM) ‘the one killed’ (MASC/FEM)
is-sitt DEF-six ‘the six’

A well-delimited subset of definite noun phrases (see especially Nos. 14, 17, 19-22 below) is exempt from such overt definiteness marking, though.

1.2. The marker concerned specializes in encoding definiteness and does not simultaneously perform further functions – such as marking topic, signalling noun-phrase-hood, or converting non-nouns to nouns. When off duty, however, it may be involved in a couple of other functions, though ones with an affinity to definiteness (see below, Nos. 24 and 25).

1.3. It is controversial whether Maltese must be credited with an indefinite article, and the reasons are partly to do with differences between the literary, journalistic, and spoken varieties of the language.

In most varieties of Maltese, especially those codified in grammars (literary, journalistic), the indefiniteness of a noun phrases is expressed negatively, i.e. by the absence of a definite article or other definitizer (a). In lieu of a genuine indefinite article the indefinite pronouns xi ‘some’
(PL) and certu / certa / certi 'certain' (MASC.SG/FEM.SG.PL) or a participle construction with an indefinite pronoun or mid-scalar quantifier as head and with the preposition minn 'of, from' may also be resorted to when the indefiniteness of a noun phrase needs special highlighting; but such indefiniteness marking is never obligatory (b). Specific reference of indefinite noun phrases is expressed by a word that is identical to the cardinal numeral 'one', wiehed / wahda (MASC/FEM), except that it precedes rather than follows its noun, or also by certu 'certain' (c).

There are indications, in particular in spoken Maltese, that wiehed / wahda, i.e. the numeral 'one' that is also used for specific reference, has actually been grammaticalized as the indefinite article, presumably under the influence of Italian, but that its obligatory use as the marker of indefiniteness is limited to animates – yielding this pattern of indefinite and specific noun phrases with animate and inanimate nouns:

In what follows the focus will be on the definite article, indubitably well-established in all varieties of Maltese.

1.4. The form of the definite article is, basically, /l/, although this is not the form to occur most frequently.

1.5. The definite article has various allomorphs, conditioned (i) by the first segment of its host (the following noun, adjective or numeral) and (ii) by the last segment of the preceding word. In particular, basic /l/ is only prevocalic (a), and there is a prothetic /l/ when the host begins with a consonant (b) and optionally also when it begins with silent gl and h (c), unless the preceding word in the same clause ends in a vowel (d); and /l/ completely assimilates to following /d/, d, n, r, s, t, f, z, ts/ (orthographically c, d, n, r, s, t, x, z, z – the so-called Sun Letters) (e).

It is the superficial rather than the underlying form of the host that counts: /l/ does not assimilate to /dy/ (g), but if stem-initial /dy/ is itself assimilated to a following voiceless consonant and ends up as /t/ (which is not reflected orthographically), the article is assimilated (again unrecorded by the orthography):

And see also No. 6 for another instance of the article's sensitivity to the surface form of its host.

The only other form to show such complete assimilation of its final consonant to following initial consonants is the verbal preformative -t. The formative -t that follows the cardinal numerals 11-19 as well as interrogative and adverbial kemm 'how many, as many as' is invariable:

Another form taking prothetic /l/ is the local particle 'il. The preposition and object marker lit has allomorphs 'il and 'l, but does not assimilate.

1.6. The definite article in turn conditions allomorphy of its host, insofar as hosts with initial /l/, m, n, s, f/ plus another consonant, and optionally also with certain other consonant clusters (such as /bd/), take prothetic /l/ in the presence of the definite article. In cases of conflict, i.e. when initial /l/, n, s, f/, which are among those consonants to cause the article to assimilate, are followed by a consonant, there is a tendency for stem-prothesis (No. 6) to take precedence over assimilation (No. 5) in the case of loan-words, Italian and other (a), while native words often allow both options, assimilation plus article-prothesis or stem-prothesis.

184

185
1.7. In a few cases the definite article has fused with a noun so intimately as to render their combination formally opaque, inconsistent with the above rules of allomorphy (a); and in at least one or two cases the definite article has been reanalysed as part of the noun, now requiring another article when definite (b).

1.8. The definite article optionally fuses with a preceding demonstrative (a), and obligatorily with certain preceding prepositions (b), whose final consonant assimilates to, or is absorbed by, the article’s (underlying) /l/. Prepositions ending in a vowel or other single consonants fuse with the definite article unchanged.

1.9. The definite article is formally unrelated to the demonstrative pronouns, which are dan/din ‘this’ (MASC/FEM) and dak/dik ‘that’, and to any 3rd person personal and possessive pronoun forms (independent hu(wa)/hi(ja), bound -u(-h)/-ha ‘he/she, his/her’). There is some formal similarity to the relative pronoun, li, fuller form illi.

1.10. The definite article distinguishes neither number nor gender (a), whereas otherwise these two categories are used for noun-phrase internal agreement. Thus, numeral and specific indefinite ‘one’, limited to the singular, agrees in gender (b), and demonstratives and adjectives agree in number and gender with nouns (c).
il-mara t-twila a contrast is likely to be implied to a woman that is not tall, while in il-mara twila the tallness of the woman is likely to be part of the addressee’s advance knowledge. Accordingly, adjectives that are inherently contrastive demand re-articulation (a), and adjectives whose meaning is such as to rule out the possibility of a referential choice, which include those often summarily referred to as ‘relational’, resist re-articulation (b):

(13) a. il-kwadru *(l-)lemini DEF-painting DEF-left
b. ir-rumanz *(l-)lewleni DEF-novel *(DEF-)single
il-knisja *(l-)lokali DEF-church *(DEF-)local
i-sipru *(l-)jawentikku DEF-spirit *(DEF-authentic
il-qagha *(l-)internazzjonal DEF-situation international

Other adjectives refusing re-articulation even when contrastive are those based on proper names:

(14) l-ilsien *(il-)Gharbi DEF-language *(DEF-)Arabic
il-President *(il-)Amerikan DEF-President *(DEF-)American

If there is more than one postnominal adjective meeting the criterion for re-articulation, all of them may indeed get an article:

(15) il-mara it-twila l-hoxna DEF-woman DEF-tall DEF-stout

It is also possible to omit the article with the first or the second adjective (or both), but the conditions of omissibility are intricate and depend on the nature of the adjectives involved.

There does not seem to be a structural contrast between noun phrases where an adjective has and where it lacks a definite article of its own; in particular, re-articulated adjectives do not seem to be less tightly bound to their nouns or less nominal than unarticulated ones.

1.13. There are circumstances where adjectives may precede their nouns, and numerals (other than ‘one’) do so regularly (a); these prenominal constituents then take the definite article, and the noun itself does not. Contemporary spoken and journalistic Maltese generally favours prenominal adjectives (b); adjectives intended as ironic move ahead (c); adjectives in the superlative are also prenominal (d), and so are comparative markers when the superlative is formed peripheristically, with the adjective itself staying behind and unarticulated (e); nouns denoting inalienable possessions, such as body parts and kin relations, resist being modified by an adjective in the normal manner, with the

possessor intervening between the noun and its adjective (re-articulated or not), and therefore resort to fronting the adjective (f), where it receives the definite article, although a possession noun in initial position would be without it, being rendered definite by the possessor nominal (see below, No. 20).

(16) a. iz-zewż *(*)lahwa DEF-two *(DEF-)siblings
b. il-famuz *(is-)strajk DEF-famous *(DEF-)strike
c. li-gheef huk DEF-wise brother:your
  ‘your clever brother’ (ironic)
d. l-iwal tifel DEF-tallest boy
e. l-ikttar tifel intelligenzi DEF-more boy intelligent
  ‘the most intelligent boy’
f. tmissier Karla xih DEF-old father Karla
  ‘Karla’s old father’

The definite article

1.14. In coordinative constructions of two (or more) definite noun phrases, the definite article must not be omitted from the second (or further) conjuncts in literary Maltese (a), unless the two (or more) conjuncts are attributives governed by the preposition ta ‘of’ and denote office, trade, or occupation (b). (By contrast, prepositions need not be repeated with second conjuncts, nor need demonstratives.)

(17) a. l-qrt u *(s-)sema DEF-earth and *(DEF-)sky
  fit-teknika u *(l-)professjoni
  in DEF-technique and *(DEF-profession
  (< fi t-teknika ...)

(b) Ministru tax-Xoghol, Impiegju Sigurta’
Minister of DEF-Public Works, Employment and Social Welfare

In contemporary journalistic Maltese, on the other hand, definite articles are generally omissible from second conjuncts:

(18) wara din it-tiflxiija u sejba after this DEF-search and discovery
  (literary: ... u s-sejba)
  fit-teknika u professjoni in DEF-technique and profession

Especially if the two conjuncts are clearly referentially distinct and not amenable to a unit interpretation, definite articles are retained with second conjuncts also in journalism:

188
1.15. When two adjectives in normal postnominal position are conjoined within a definite NP, the definite article is omissible from the second.

(20) il-mara it-twila u (l-ħoxna) DEF-woman DEF-tall and (DEF-)stout

Coordinate adjectives thus do not differ greatly from stacked adjectives (No. 12), although the omissibility conditions are less straightforward in the case of stacking.

1.16. In addition to prototypical count nouns the nouns that require a definite article in definite noun phrases include those denoting substances (a), colours (b), and abstract notions (c).

(21) a. il-hadid DEF-iron
    id-dqiq DEF-flour
    l-ilma DEF-water
c. bi-ahmar with:DEF red ‘with red’
    b. it-tama DEF-hope
    is-sengha DEF-art
    is-sabar DEF-patience
    is-sahha DEF-health

1.17. In spite of the relevant noun phrases being definite, the definite article is not used with a subset of nouns. This subset of nouns that may be considered inherently definite includes proper names of (a) persons, (b) some countries (mostly ones situated on islands of the same name), (c) (some) islands, (d) some bays, (e) some towns, (f) some villages, and (g) months, but it does not include proper names of (h) other countries (and islands?); (i) other bays, (j) other towns, (k) other villages, (l) mountains, (m) roads, (n) seas, (o) week days, (p) holidays, (q) seasons, (r) languages, and (s) academic subjects, as well as (t) proper names of persons accompanied by a title, all of which require the definite article.

(22) a. (*il-)Manwel, (*il-)Mifsud, (*il-)Albert (*il-)Borg, (*is-)San Gwann
    b. Malta, Gappun, Franza, Spanja
    c. Ghawdex, Kemmuna, Filfla, Sqallija Sicily, Rodi Rhodes
    d. Marsaxlokk, (San Pawl il-Bahar)
    e. Valletta, Victoria Marsalfon, Napli, Ruma, Gerusalem, Londra
    f. Sannat, (Bormla q Bur Mula meadow of the lord)

1.18. When a proper name that does not take a definite article is accompanied by a restrictive relative clause or restrictive attributive adjective, it does take the definite article.

(23) h. (l-)Olanda, (l-)Izrael, Spanja/l-Ispanja

1.19. In spite of the relevant noun phrases being definite, the definite article is not used with personal (a) or relative pronouns (b).

(25) a. (*il-)hu marid (*DEF-)he sick
    (*il-)li kilt (*DEF-)I eaten
     'he is sick'
     'I have eaten'

    b. il-mara (*il-)li ...
    DEF-woman (*DEF-)who ...
    DEF-lads of-him ...
    DEF-captain (*DEF-)who ...
    il-kaptan (*il-)li s-subien tiegh-u ...
    'the woman who ...
    'the captain whose lads ...

1.20. In spite of the relevant noun phrases being definite, the definite article is not used with nouns carrying possessive suffixes (a). It is used, however, with nouns followed by a possessive suffix attached to the
preposition ta' (b); see also No. 19 (b) on such prepositional possessives in relative clauses relativizing on attributive nouns.

(26) a. (*id-kdar-i) (*DEF-house-my)
    (*iz-zewg-ha) (*DEF-husband-her)
    (*is-isbien-u) (*DEF-lads-his)
    b. iz-zewg tagh-a xih u ikrah 'the husband of her old and ugly' 'her old and ugly husband'

In the spelling of contemporary journalistic Maltese the definite article occasionally does accompany nouns with a possessive suffix when they are preceded by the preposition lil 'to':

(27) lill-pajizz-na (= lil-l) to-DEF-country-our

1.21. In spite of the relevant noun phrases being definite, the definite article is not used with nouns in the construct state, i.e. when followed by a nominal attributive not marked by a preposition (a). Prepositional-phrase attributives, which likewise follow their head, do not preclude the definite article on the head and, unlike construct-state attributives, indeed combine with indefinite heads (b).

(28) a. lehen Manwel voice Manwel 'Manwel's voice'
    lehen l-avukat voice DEF-advocate 'the advocate's voice'
    bin is-sultan son DEF-sultan 'the sultan's son'
    missier u omm il-mara father and mother DEF-wife 'the father and the mother of the wife'
    bieb dar is-sultan door house DEF-sultan 'the door of the house of the sultan'
    b. in-nies ta' Malta DEF-people of Malta 'the people of Malta'
    il-lehen ta' l-avukat DEF-voice of DEF-advocate 'the voice of the advocate'
    iiben ta' l-avukat son of DEF-advocate 'a son of the advocate'

(Iben 'son' and singular feminines in -a are the only nouns to have a distinct construct-state form).

1.22. In spite of the relevant noun phrases being definite, the definite article is not used with vocative nouns, vocative being expressed by the particles ja or a.

(29) ja/o (*ir-)Russja! oh (*DEF-)Russia!

1.23. Alone among the constituents rendering a noun phrase definite, the demonstrative pronouns require the company of the definite article, provided the noun permits the definite article in the first place.

(30) dan *(il-)ktieb this *(DEF-)book
    dik *(il-)mara that *(DEF-)woman
    dan Jannar this January

The articulation requirement in noun phrases with a demonstrative does not extend to attributive adjectives, which may be re-articulated or unarticulated (depending on whether or not they are restrictive) as they would be in noun phrases without a demonstrative;

(31) dawk il-kotbah (1)-hodor those DEF-book-PL (DEF-green)

1.24. The definite article is involved in the conversion of cardinal numerals (a) into ordinal numerals (b).

(32) a. sitt irgjeł six man:PL 'six men'
    is-sitt irgjeł DEF-six man:PL 'the six men'
    b. is-sittراجel DEF-six man:SG 'the sixth man'

The numerals 1-4 and 100 have slightly or radically different cardinal and ordinal forms; nonetheless, ordinal numerals always take the definite article. This, however, does not suffice to distinguish them from cardinal numerals (other than 1-4 and 100), which are also accompanied by the definite article when their noun phrase is definite (a). It is the combination of a definite article and a noun in the singular that turns cardinal numerals (above 1) into ordinals (b). Alas, with numerals above 10 nouns are in the singular in Maltese anyway, which obliterates the distinction between definite noun phrases with such cardinal and corresponding ordinal numerals; for instance:

(33) il-ghoxrin student DEF-twenty man:SG 'the twenty students'/the twentieth student'

It would help clarify the role of the article to know (i) how perfectly reasonable requests such as '[the five of us need] a sixth man [to topple over the Ggantija megaliths]' are made in Maltese, and (ii) whether is-sitt irgjeł might not perhaps also mean '[these are already] the sixth [group of] men [to crawl down Calypso's Cave today]' (or, if not, how else to put such keen empirical observations into words).

1.25. The definite article is also implicated, if perhaps marginally, in
distinguishing superlatives, which lack any specialized marking of their own, from comparatives.

Looking at synthetic comparatives, the only ostensible difference between attributive comparatives and superlatives is that the latter are moved ahead of the noun, with the noun losing its own article in the process, as it regularly does when non-initial (No. 13).

(34)  
\[
\begin{align*}
il\text{-belt} & : \text{DEF-city}\quad \text{DEF-powerful} \\
il\text{-belt} & : \text{DEF-city}\quad \text{DEF-more:powerful} \\
l\text{-aqwa} & : \text{DEF-more:powerful} \\
l\text{-aqwa} & : \text{DEF-city}\quad \text{DEF-more:powerful} \\
\end{align*}
\]

'powerful city'

'l-aqwa' 'the more powerful city'

'l-aqwa' 'the most powerful city'

If the corresponding indefinite noun phrases were as follows, the definite article would be seen to play a role in distinguishing superlatives from comparatives:

(35)  
\[
\begin{align*}
\text{belt qawwi} & : \text{city}\quad \text{powerful} \\
\text{belt aqwa} & : \text{city}\quad \text{powerful} \\
\text{l-aqwa} & : \text{city}\quad \text{more:powerful} \\
\text{l-aqwa} & : \text{city}\quad \text{more:powerful} \\
\end{align*}
\]

'a powerful city'

'a more powerful city'

'a most powerful city'

The last noun phrase being indefinite, its definite article would evidently not be doing what is does otherwise; its function here could only be to transform a comparative into a superlative. However, it is questionable whether Maltese permits such elatives, or their inverted alternatives, with or without the article on the initial comparative.

(36)  
\[
\begin{align*}
\text{l-aqwa} & : \text{more:powerful} \\
\text{l-aqwa} & : \text{more:powerful} \\
\end{align*}
\]

'a most powerful city'

When comparison is periphrastic, both comparatives and superlatives do remain postnominal in indefinite noun phrases, and the only difference between them is that the superlative marker (historically the synthetic comparative of an adjective) gets the definite article.

(37)  
\[
\begin{align*}
\text{ktieb sabih} & : \text{book}\quad \text{beautiful} \\
\text{ktieb aktar sabih} & : \text{book}\quad \text{more beautiful} \\
\text{ktieb l-aktar sabih} & : \text{book}\quad \text{DEF-more:beautiful} \\
\end{align*}
\]

'a beautiful book'

'a more beautiful book'

'a most beautiful book'

In definite noun phrases periphrastic comparatives and superlatives may likewise stay after the noun, which causes the distinction between them to be neutralized: there actually ought to be two articles in the superlative - one the definite article in its accustomed role as (repeated) definiteness marker and the other an article look-alike serving as a superlative marker, which is what it clearly does in the indefinite periphrastic paradigm (37) - but there is only one.

(38)  
\[
\begin{align*}
\text{il-ktieb is-sabih} & : \text{DEF-book}\quad \text{DEF-beautiful} \\
\text{il-ktieb l-aktar sabih} & : \text{DEF-book}\quad \text{DEF-more:beautiful} \\
\end{align*}
\]

'the beautiful book'

'the more/most beautiful book'

When the comparative marker takes the option of moving ahead of the noun, the adjective is unambiguously identifiable as superlative on the strength of the ordering rule that allows superlatives to assume prenominal position - not on the evidence of the article, because there only remains one, and this is the minimum for a definite noun phrase.

(39)  
\[
\begin{align*}
\text{l-aktar ktieb sabih} & : \text{DEF-more:book}\quad \text{beautiful} \\
\end{align*}
\]

'a most beautiful book'

In conclusion, the article shares in the marking of the superlative grade in Maltese, but owing to circumstances - to do with ordering regulations and the avoidance of article repetition - this is only a supporting role that is hardly worth the effort.

1.26. None of these 25 truths is guaranteed to be the full truth. They might all be half-truths or less, missing out on all kinds of things which the form, distribution, and functions of the Maltese article could be part and parcel of.

Conceivably, the article that Maltese has and the way it is using it might be to do, directly or indirectly, with, say, (a) word order being basically, though not invariably, SVO, except in adverbial subordinate clauses, where the preference is for VSO; (b) adpositions being placed before rather than after their noun phrases; (c) attributive noun phrases of any kind following their head nouns; (d) relational alignments being essentially all nominative-accusative; (e) pro dropping; (f) affixal case marking being unknown; (g) some nouns but no pronouns inflecting for the dual; (h) verb phrases being productively marked for aspectual contrasts; (i) intransitive predication being unusually versatile; (j) morphology being to some extent introjective, though not adverse to both prefixes and suffixes; (k) word stress being on the ultimate syllable if
heavy (long vowel or short vowel plus two consonants), and otherwise on
the penultimate; (l) syllable-final consonants being devoiced; (m) Malte-
see being genetically Arabic but having over the centuries been in close
contact with a wide range of North African and European languages,
most recently English and Italian (Sicilian).

Looking only at Maltese, there is not much prospect of knowing
whether or not these further truths are the other halves of any (half-
truth concerning its article, strange bedfellows though they might seem.
It is all a question of how persistently such truths seek or shun each
other's company in places other than Malta, Ghardex, and Kemuna.

2. Question

Are these 25 truths really all peculiar to Maltese? Or are some or all
of them general truths about Language, or derivative of such more
general truths? In particular, are any of these truths interdependent
with one another or with any others (like those in the motley collection
in No. 26 above), reflecting universal implications?

3. Answers

3.1. Recurrent, predictable, both

The basic question raised by Plank is this: "Are the 25 truths really
all peculiar to Maltese?" There are two concerns underlying this query,
one related to frequency and the other to predictability: (i) Do these facts
occur only in Maltese or do they have parallels in other languages? (ii)
Are these facts independent of the rest of the grammar or are they
necessary consequences of other structural characteristics of Maltese?
The two issues are independent of each other. Although grammatical
phenomena found in only one language are more likely to be isolated
from the rest of the grammar, they may nonetheless be predictable from
another equally rare property; and, in turn, common features may not be
implicationally linked to anything else.

In this section (3.1) it will be suggested that several of the facts
about Maltese articles are either recurrent or predictable or both.
Twelve of the 25 factual statements will be discussed, under the follow-

1. Phonological form of articles (Nos. 3, 9)
2. Co-occurrence and order of the article within the noun phrase:
whose form was quite distinct from demonstratives. Thus, Maltese, with its non-demonstrative-like definite article, represents a non-predominant but nonetheless widely documented pattern.

In spite of its formal distinctness from demonstratives, the Maltese definite article nonetheless does not stray too far from the cross-linguistically most common pattern. No. 9 also notes that the Maltese definite article is very similar in shape to the relative pronoun. But relative pronouns are in turn often identical to demonstrative pronouns: Downing (1978: 385) cites German, Ewe, and Umbundu as examples. Thus, even though the Maltese definite article does not formally resemble a demonstrative, it bears similarity to a category – relative pronouns – which, in other languages, is serviced by demonstratives.

In addition to providing information about crosslinguistic frequency, Dryer's paper also offers a statistical universal in which the non-demonstrative-like form of the definite article serves as the implicants. Dryer found that “the more distinct the definite article form is from demonstratives, the more likely its position relative to the noun will correlate with the order of verb and object” (1989: 90), with the article being the positional equivalent of the verb. Since Maltese is a VO language with a strongly non-demonstrative-like definite article, the generalization correctly predicts the article's prenominal position noted in No. 11.

3.1.2. Co-occurrence and order of the article within the noun phrase

3.1.2.1. Article and head (Nos. 17, 18, 19)

The list of items given in No. 17 regarding what must and must not take the definite article in Maltese is familiar. There are several parallels from Hungarian as well from Portuguese (Krámáry 1972: 79-81), Italian (Krámáry 1972: 123-126), and English. For example, Krámáry points out (79) that in Portuguese, “rivers, mountains and seas” must take the definite article and this is what mountains and seas do in Maltese as well. He also says that, while personal proper names do not take the article in Portuguese (80), proper names accompanied by an attributive do (79), which, according to No. 18, is also the case in Maltese. Similarly, the fact that names of months remain articleless in Maltese is paralleled by Portuguese (80) as well as by many other languages.

The fact that pronominal heads do not take the definite article (No. 19) is a very widespread and possibly universal phenomenon, explainable to an extent by the frequently attested pronominal nature of the article itself (cf. Moravcsik 1994).

3.1.2. Article and demonstrative (Nos. 11, 23)

Among the various points made in No. 11 is the fact that the adnominal demonstrative co-occurs with the definite article in Maltese and that, in particular, it precedes it. While the co-occurrence pattern is recurrent across languages but apparently unpredictable for Maltese, the linear realization may be universal.

Regarding co-occurrence: the adnominal demonstrative is unarticulated in English, German, or French but it is optionally or obligatorily accompanied by the definite article in many languages, such as Efate, Samoan, Santo, etc. (Moravcsik 1969: 76), or Abkhaz, Bella Coola, Bernice Dutch Creole, etc. (Rijkhoff 1992: 154-157). Plank (1991: 2: 6) proposes an implicational generalization from which the co-occurrence of article and demonstrative is predictable in some languages: if articles co-occur with pronominal possessors, demonstratives do so as well. However, this regularity does not serve to predict the Maltese Demonstrative-with-Article construction since the implicans is not fulfilled: pronominal possessors and articles cannot both occur with the same noun in Maltese (cf. No. 20).

Once articles and demonstratives are allowed to co-occur, there is some indication that their linear order is universally determined if they occur on the same side of the head noun: the demonstrative is consistently more peripheral than the article. This is suggested by Rijkhoff's findings (1992: 152). In his sample of 48 languages, 11 allow the co-occurrence of demonstratives and articles and in all 4 languages that order the two ipsilaterally (Abkhaz, Modern Greek, Guarani, and Hungarian), they are prenominal with the demonstrative preceding the article. The Maltese order is thus an instantiation of this general pattern.

The peripherality of the adnominal demonstrative would be explained if the demonstrative were analysed as a separate noun phrase to which the rest of the phrase – the article and the noun – is appended in appositive-like fashion (cf. Rijkhoff 1992: 153). The head-like status of the adnominal demonstrative, which this analysis suggests, turns out to be supportable by two kinds of evidence outside linear order.

First, adnominal demonstratives generally – perhaps universally – have nominal use as well; e.g., in English, both “this book” and “this” are noun phrases. Greenberg states this to be the case for “most languages” (Greenberg 1978: 75). This is in contrast with the behavior of other nominal satellites: “beautiful books” is a noun phrase but “beautiful” is not.

Second, from among demonstratives, articles, and adnominal adjectives, the category that most frequently shows the inflectional catego-
ries of the head noun is demonstratives (Siewierska & Bakker 1992: 2; Plank 1994: 50-51). Strikingly, Hungarian adnominal demonstratives are so consistent in agreeing with the head noun in case that they do so not only in affixal case but even in postpositional case (Moravcsik 1995: §9.9 and section 3.1.7). What this shows is that adnominal demonstratives are not only capable of standing as nouns but they take on the inflectional garb of nouns even in adnominal position.

Since both of these properties of adnominal demonstratives — agreement and nominal use — are present in Maltese as well, the appositive-like character of the Maltese article is supported, which in turn explains the Demonstrative-before-Article order.

3.1.2.3. Article and adjective (No. 12)

A similar case may be made for adjectives in Maltese. As stated in No. 12, the postnominal attributive adjective may repeat the definite article of the head noun. Articled adjectives are a recurrent feature across languages especially if they follow the noun and if they involve the definite article (Plank 1995b: 7-12). This may be so because the postnominal adjective is in some respects a separate noun phrase in apposition to the one that contains the noun. A piece of evidence to further document the appositive nature of postnominal adjectives comes from Greenberg's generalization (Greenberg 1963: No. 40), according to which postnominal adjectives have an edge over prenominal ones in taking on the inflectional categories of the head noun.

3.1.2.4. Article and possessor (Nos. 20, 21)

The fact that Maltese has two possessor constructions is paralleled in other languages such as English, German, Finnish (Jokinen 1991), Lithuanian (Payne 1994), or Hungarian (Szabolcs 1994). More strikingly, some of the particular ways in which the two constructions differ are also similar: in one construction the possessor is more determiner-like while in the other it is more modifier-like. Languages with two genitives thus seem to represent the paradigmatic co-occurrence of two distinct types each of which can also be the sole genitive construction of a language (cf. Lyons 1986, Plank 1992c).

Let us take Hungarian as an example to point out some crosslinguistic parallels to the Maltese situation. In Maltese, as noted in No. 21 and further expanded on by Fabri (this volume) and Koptjevskaja-Tamm (this volume), the clusters of features that characterize the two possessive constructions include the following:

(1) possessum can be any noun? no yes
(2) possessum can take article? no yes
(3) possessum can take other satellites? no yes
(4) possessor agrees with possessum? yes or no yes
(5) possessor is case-marked? no yes
(6) order of possessum and possessor free? yes or no yes

(Regarding features Nos. 4 and 6: agreement and free order co-vary: possessor and possessum have free order if the possessum agrees with the possessor but not otherwise.)

Some of these features cluster the same way in Hungarian. Here are examples of the two constructions:

- construct-state-like possessive construction:
  Mari kez-é
  Mari hand-3SG
  'Mari's hand'
- analytic possessive construction:
  Mari-nak a kez-é
  Mari-GEN the hand-3SG
  'Mari's hand'

The construct-like possessive in Hungarian shares three features with the Maltese construct-state possessive construction: the non-occurrence of the article with the possessum (2), non-case-marked possessor (5), and rigid order (6). The Hungarian construction is, however, freer than its Maltese counterpart since the possessum is not lexically restricted to inalienable possession (1), it may take adjectives and numerals (2), and it seems to have more independence in that it in all instances incorporates features of the possessor through agreement. In spite of the differences, it is still true that in both languages, one of the two constructions involves a closer relationship between possessor and possessum than the other does (cf. Koptjevskaja-Tamm, this volume: section 0.).

A general issue that is latent across points 3.1.2.1, 3.1.2.2, and 3.1.2.4 — whether the definite article may or may not occur with nouns that are either inherently definite or which already have determiners such as a demonstrative or a possessor — is the additive versus redundant status of the definite article. The question is this: does the definite article confer definiteness on the noun or does it duplicate it? Languages differ in this regard, just as they do regarding the article's function as a
nominalizer, as a formative of superlatives and ordinals, and as an indicator of gender, number, and case; in all of these cases, the article is the sole carrier of these functions in some languages while in others it simply duplicates information stated by other noun phrase constituents (cf. Moravcsik 1994). Apparently, variation holds not only crosslinguistically but also language-internally: a language does not always uniformly opt for either economy or redundancy. In Maltese, for example, the article is allowed to be redundantly present in noun phrases that include a demonstrative but not with proper names and possessed nouns in the construct state. Whatever dependencies may govern the distribution of the article-as-adding-information and the article-as-repeating-information are to my knowledge yet unexplored.

3.1.2.5. Article and conjuncts (No. 14)

In Maltese, non-initial conjuncts must have their own articles (No. 14). Whether this is required or not is a variable property of languages. Spanish and French are like Maltese (cf. Plank 1991 (1)), but in Portuguese, for example, the repetition of the article on a non-initial conjuncts is ungrammatical (Krassmky 1972: 81). For a cross-linguistic survey of this parameter, see Plank (1991 (1)).

3.1.2.6. Article and case (Nos. 3, 22)

Definiteness and case may be crosslinguistically linked in two ways. First, the definiteness status of an unarticled noun phrase may depend on the case of the noun phrase. In articleless languages, if a case marker forces definite interpretation, that case is likely to be the accusative; and if a case forces indefinite interpretation, that case is likely to be the genitive or partitive. For example, Turkish accusatively marked nouns can only be interpreted as definite (or specific), and in Finnish, Estonian, and Basque, partitive objects — just as genitively marked objects in Polish or Russian — often favor an indefinite interpretation (cf. Moravcsik 1978: 265-272). Maltese fits this pattern: as noted in No. 3, one of the expressions of indefiniteness is supplied by the partitive construction.

The second way in which case may condition definiteness holds in languages that do have articles: certain cases may be restricted to or banned from co-occurrence with one or the other article. An instance of this occurs in Maltese: the vocative does not collocate with the definite article (No. 22). Although vocatives seem predominantly articleless across languages, the Maltese situation is not fully predictable: Szabolcsi (1994: section 5.2) cites Rumanian as a language where the definite article can occur with vocative nouns and Greenberg points at Lotuko as a similar counterexample (1978: 65). The Maltese pattern is thus probable but not necessary.

3.1.3. Conclusion

In conclusion, it was suggested that none of the aspects of the Maltese article considered here were unique: they are either crosslinguistically recurrent or typologically predictable or both. Here is an overview:

- Maltese article features that are crosslinguistically recurrent but not predictable:
  (a) lexical constraints on the head noun for occurring with the definite article (Nos. 17, 18)
  (b) the co-occurrence of the demonstrative and the definite article (Nos. 11, 23)
  (c) the existence of a determiner-like and a modifier-like possessive construction (Nos. 20, 21)
  (d) the obligatory repetition of the definite article on non-initial conjuncts (No. 14)

- Maltese article features that are crosslinguistically recurrent and statistically predictable:
  (a) indefinite article arising from the numeral ‘one’ (No. 3)
  (b) definite article distinct in shape from any demonstrative (No. 9)
  (c) artificed adjectives being post-nominal (No. 12)
  (d) vocative nouns not taking articles (No. 22)
  (e) the definite article being pre-nominal (Nos. 11, 23)

- Maltese article features that are crosslinguistically recurrent and predictable by possibly exceptionless universals:
  (a) the demonstrative having a more peripheral position than the article (Nos. 11, 23)
  (b) the absence of articles with pronominal heads (No. 19)
  (c) the partitive construction forcing indefinite interpretation (No. 3)
  (d) the numeral ‘one’ turning into an indefinite article (No. 3)

3.2. Existence and behaviour

3.2.1. Truths of existence

If you pick a language at random, what are the odds that it will have an article? It has been conjectured by Dryer (1989), on the basis of a 600-strong sample, that as many as about a third of the world’s languages employ articles. It would thus be against the odds, although not espe-
ically heavy ones, that Maltese comes out having one. But then it is questionable whether Maltese in fact has an article in Dryer’s sense. It is of course not self-evident how to recognize an article if you see one. Dryer defines articles as “words indicating definiteness or indefiniteness, or some related discourse notion” and/or as “words serving as a noun phrase marker in the sense that noun phrases in the language... typically occur with one of the words in question” (1989: 83). If articles are instead defined — perhaps more naturally, although with no intention of settling all potentially divisive issues — as grammatical markers that specialize, if not necessarily exclusively, in distinguishing the noun phrases in which they occur as definite and indefinite, pure noun phrase markers would be excluded from this category (as irrelevant for definiteness) and bound forms that are functionally equivalent to independent words would be included (with the distinction between affixes morphologically bound to stems and clitics leaning on hosts being notoriously hard to draw). Since noun phrase markers were relatively rare in Dryer’s sample and since bound definiteness marking is not so uncommon, the figure of one third is likely to increase on this re-definition. It is perhaps not too wide of the mark to assume that about a quarter of the world’s languages have article words and another quarter or perhaps a little less have bound articles.

The areal distribution of article words is uneven. Apparently Europe is the most fertile soil for them. Thus, if nothing were known about the presence or absence of articles in Maltese, its location halfway between Europe and North Africa, with historical ties to either of its neighbouring continents, could be taken into account as a factor further improving its chances to go on record as a member of the free article club. Concerning the likelihood of bound definiteness marking, little would seem to follow from its whereabouts.

While it would not be true to say that if a language has an indefinite article then it will also have a definite article, it is still considerably less wrong than to maintain that if a language has a definite article then it will also have an indefinite article. That is, among languages with an article it is most common to have only a definite article. What is second most common is to have both a definite and an indefinite article, and it is by far least common to have only an indefinite article (Moravcsik 1969: 87, 93-88; Dryer 1989: 86). Thus, knowing that Maltese has only got one well-established article, with another one at best dubious, the safest bet is that it will be definite.

As to structural properties that might be conducive to having or lacking articles, Moravcsik (1969: 87) professed ignorance: “During a rather cursory investigation, no typological criteria were found in only those languages which have or which lack obligatory definiteness or indefiniteness markers; all that can be said now is that if there are such properties, they must be sought among features of language that change relatively fast, rather than among more pervasive ones.”

But that was perhaps unduly cautious. With word order sometimes considered the most pervasive typological determinant, why should it not also figure in correlations involving articles? It has in fact been claimed recently by Stassen (1992, No. 1b), on the basis of a fairly large sample, that having obligatory marking for (in)definiteness correlates positively with SVO and negatively with SOV. This is in accordance with Calboil’s (1978: 212, 252) speculation, drawing on the evidence of a narrowly Indo-European sample, that as languages change from SOV to SVO, they tend to develop articles from demonstratives and the numeral ‘one’ (as well as to abandon accusative-with-infinitive constructions). In a similar vein, one of the earliest typologists, the Abbé Gabriel Girard (1747), had already maintained, again on very limited evidence, that if constituent order is rigid rather than flexible — and for Girard rigid order was tantamount to SVO — then there will be a definite article, but not vice versa (see Plank 1992a: 38-40). On the strength of such hypotheses, which are lent plausibility by the rough agreement in the probable percentages of languages opting for SVO (about 40%) and having articles (about 50% or a little less), it does not come as a surprise that Maltese has a definite article, given that it is basically SVO (as per No. 26 above). And God knows how much else correlates with SVO besides articles — proliferative rather than agglutinative morphology, an aversion to nominal cases, iambic rather than trochaic rhythm ... (see Plank 1995a).

Since the ordering of S, O, and V can be used for a purpose that is also crucially served by articles, viz. the topic-comment or given-new structuring of utterances, formal economy might dictate that languages make a choice between the various means of expression on offer. Accordingly, if word order is utilized for topic-comment structuring, the need for articles to share in this task should not be urgent; and if there are articles distinguishing given and new, the ordering of S, O, and V should be available for other tasks, such as that of encoding grammatical relations. And a whole lot of other things, including the expediency of other relational marking (by means of case or agreement), are arguably correlated with word order being ‘free’ or ‘fixed’. Direct links have also been postulated between articles and relational marking other than by order; for instance, if there are no articles then there is case marking on nouns, at least in the languages of Europe (Siewierska & Bakker 1992, No. 225). Now, while the ordering of S, O, and V in Maltese is not rigidly SVO (see Borg 1988: 114-148), it is perhaps not flexible enough either for us to be confident that the services of articles can be safely dispensed with.
Owing to their contribution to the expression of aspectual distinctions, especially that of perfective vs. imperfective or telic vs. atelic, articles have also been correlated with other aspectual marking. According to Kabakchiev (1984a/b), relevant aspectual distinctions are either expressed in the verb phrase or in the noun phrase (especially by articles or case oppositions), or sometimes also in both. Languages can in principle do without articles if other formal means are available for this purpose, while articles come in particularly handy when there is no verbal or other nominal aspectual marking. Given that Maltese is well equipped to deal with aspects both verbally and nominally (see Borg 1981, 1988: 59-113), there would not really be a desperate need for articles from this point of view.

Articles also figure in the configurationality/count-mass typology proposed by Gil (1987). With reference to Table 10.2 on page 263 of this paper, Maltese comes out as A - A - A - ? - A - ? (where the question marks represent Gil’s lack of knowledge, not having yet located the Maltese community in Singapore). The first A says that Maltese has obligatory (in)definiteness marking, while the remaining A’s say that Maltese has all the other properties one would expect of a language with obligatory (in)definiteness marking, namely number marking, no numeral classifiers, no adnominal distributive numerals, and no stacked numerals.

There are some indications, then, that having or not having articles is not something that is independent of everything else. All in all, it is especially its not fully flexible SVO order, and whatever goes with it, that predisposes Maltese to embrace articles, or preferably only the definite article if it is not going to be the full complement.

3.2.2. Truths of behaviour

If you pick an article at random, what are the odds that it will have the form, distribution, and functions that the article happens to have in Maltese?

You will certainly be offered long odds that the basic shape of a (definite) article will be /l/ - although if the article’s habitat is near Italy the odds may be shorter, especially those you will be laid for the allomorph /l/.

However, it is odds-on that an article will not be much longer than that of Maltese, in terms of segments or syllables. Grammemes tend to be less substantial than lexemes.

And the odds are that a whole lot of other, and perhaps more interesting, things are also the way they are in Maltese because this is the way they are in general.

It may to some extent be a question of areal style whether an article is word-marking or phrase-marking. Irrespective of area, one might expect various formal and distributional properties to follow from the classification of an article (or any other item) as word-marking or phrase-marking. To mention only some (see Plank 1992b): typically, word-markers are firmly associated with word-stems of particular categories regardless of the position of their carriers in the phrase, while phrase-markers accompany whole phrases or, if clitics, are hosted by one or another constituent of the phrase depending on its position; typically, the bond between a word-marker and its carrier is stronger than that between a phrase-marker and its host, as is reflected in the ability or inability to effect allomorphic changes or in the omission or inomissibility under identity; typically, word-markers are available for phrase-internal agreement but phrase-markers are not. However, the expectation that these respective opposites perform go hand in hand is counterfactual, and is once more undermined by the Maltese article. Its distribution (as described above in Nos. 1, 11, 12, 13, 15) is generally that of a proclitic phrase-marker, except that forms of this kind would be expected to be freely omissible from second conjuncts under identity (No. 14). The inclination of the definite article to fuse with a preceding demonstrative or preposition instead of holding on to the following noun (No. 8) is again more typical of a clitic than of a prefix. On the other hand, the allomorphic changes that the definite article is subject to, in particular the assimilations of /l/ to the surface form of following consonants (No. 5), are reminiscent of the typical influences on affixes rather than on clitics; at least there are no clitics in Maltese which share such allomorphic behaviour. Also, the occasional re-analyses of articles as part of the noun stem (No. 7) are more in line with prefixal than with proclitic status. If the re-articulation of restrictive postnominal adjectives is a case of agreement (No. 12), such a distribution over more than one constituents of a single noun phrase would also be more characteristic of word-markers than of phrase-markers. It remains to be seen, then, whether mixtures of properties of the opposite extremes of word-markers and phrase-markers, or affixes and clitics, as exemplified by the Maltese definite article, are random or regular.

However predictably or unpredictably the properties of the Maltese article are assembled, it is to be expected that, to the extent it is omissible, the lack of referential autonomy of an item conjoined favours its omission under identity (Nos. 14 and 15).

Not all definite noun phrases contain the definite article in Maltese. Its choosiness is likely not to be entirely idiosyncratic. Presumably, personal pronouns and proper names of persons and probably also certain places head the universal hierarchy of nominals whose definiteness is not contingent on the presence of a definite article (Nos. 18 and
position of the genitive in front of its head as its *implicatum*. Rumanian is the only European exception they are aware of; Maltese is another (No. 26) – if its definite article counts as properly bound.

If articles fuse with words other than nouns or other members of the noun phrases they mark as definite or indefinite, adpositions would generally seem to be the words most eager to go into such a partnership, followed by demonstratives, provided these may co-occur with articles to begin with (No. 8).

Truth No. 10, recording the failure of the Maltese article to agree, is what you expect, given that the European hierarchy of agreement targets is as follows (Siewierska & Bakker 1992: 2):

**demonstrative > attributive adjective > predicate adjective > article**

Thus, at least in Europe, articles are the least likely of all determining and modifying words to agree with nouns; in Maltese they do not, while demonstratives and adjectives do – having it the other way round would be decidedly un-European. Distinguishing only determiners and modifiers, although without limiting his sample to Europe, Plank (1994: 50-51) suggests that if determiners agree within noun phrases, modifiers are likelier also to agree than not to agree, which coincides with Siewierska & Bakker’s European hierarchy only in part, insofar as demonstratives are downgraded. Again, Maltese does not offend: at least some determiners (demonstratives) agree, and so do adjectival modifiers.

When definite articles are asked to share in the responsibility for expressive tasks other than that of distinguishing definite and indefinite noun phrases, distinguishing ordinal from cardinal numerals and superlatives from comparatives, as in Maltese (Nos. 24 and 25), is what they are not at all unwilling to lend a hand to (Moravcsik 1969, Plank 1995b). They have also been observed masquerading as correlative conjunctions or adverbs (the sooner the better), but this seems a peculiarly English habit, which not even the 150 years of British rule have persuaded Maltese to copy.

**Acknowledgments**

Plank is responsible for Parts 1, 2, and 3.2, Moravcsik for Part 3.1. The former is grateful to Albert Borg for correcting several mistakes in earlier drafts of Part 1, and to David Gil for contributing a summary of Gil (1987), as applied to Maltese, to Part 3.2. Plank’s sources for Part 1 were Aquillina 1965, Borg (this volume), Brincat 1973, Fabri 1993, Fenech 1978, Schabert 1976, Sutcliffe 1936, and Vella (n.d.).
